

Frese EVA BASIC - 2 way Automatic Balancing Valve

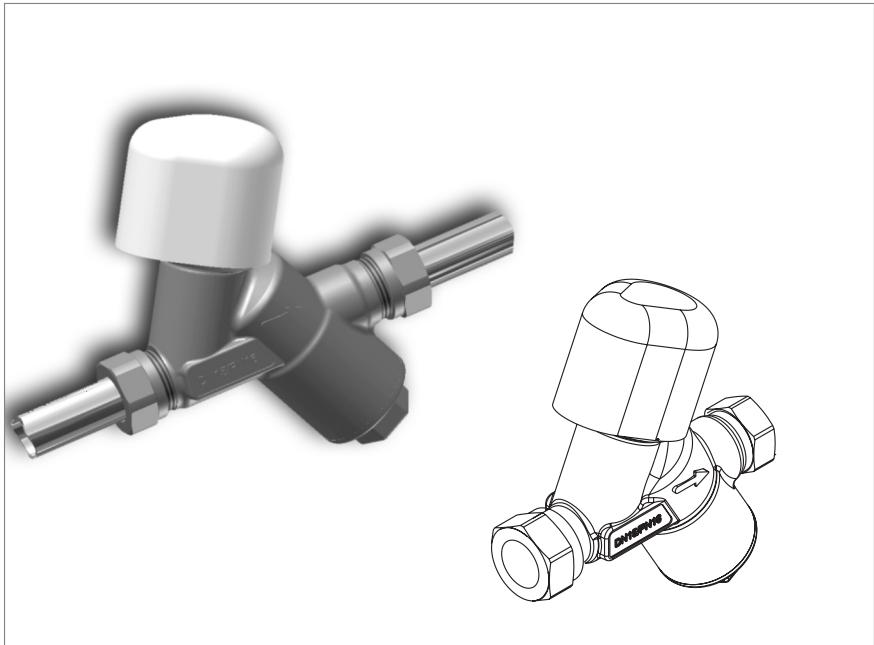

Page 1 of 4

Application

Frese EVA BASIC is a valve particularly designed for the balancing of cooling and heating units, cooling ceilings/beams and fan coil units.

With its simple on/off control the valve can be used for many different applications and at the same time advantage is derived from the dynamic control principles.

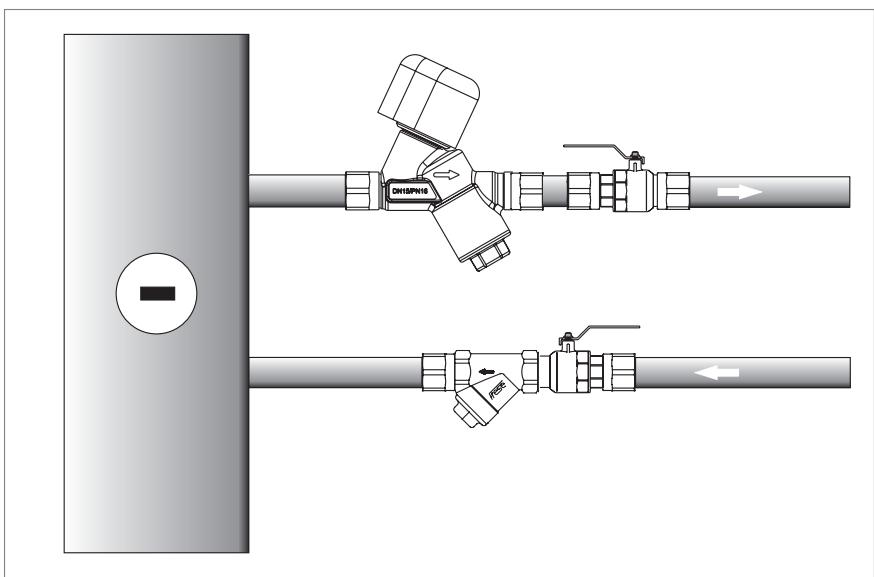

By means of Frese EVA BASIC the optimum flow rate is ensured in each control area. This flow rate is maintained in spite of pressure fluctuations in the system.

Frese EVA BASIC male/male for couplings and actuator - here shown with press couplings and compression couplings respectively.

Advantages

- No requirement on pipe lengths before and after the valve.
- Small compact product.
- Time consuming adjustment of the system is eliminated.
- The valve automatically ensures hydraulic balance regardless of pressure fluctuations in the system.
- On/off function for electrically operated actuator (normally closed).
- The valve can be easily fitted into the system by means of the wide union programme.

Frese EVA BASIC - installed in the return side of the cooling-/heating surfaces.

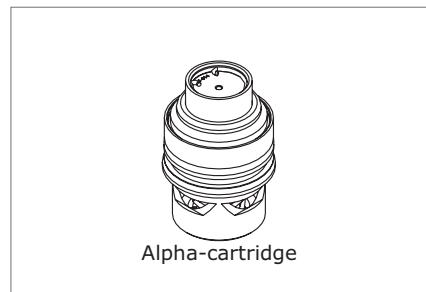

Function Cartridges

Balancing occurs by means of a flow rate cartridge, in which the differential pressure is kept constant across the orifice.

In the wanted control range the pump supplies sufficient differential pressure to

influence the spring and diaphragm of the flow rate cartridge.

Consequently, the flow rate is kept constant in spite of pressure fluctuations, if any, in the system.

Technical data

Valve housing:	Hot forged brass
O-rings:	EPDM
Pressure rating:	PN16
Temperature of the medium:	0 to + 95°C
Ambient temperature:	0 to + 50°C
Pressure range (cartridges):	7 - 410 kPa
Flow range:	See Cartridge Catalogue

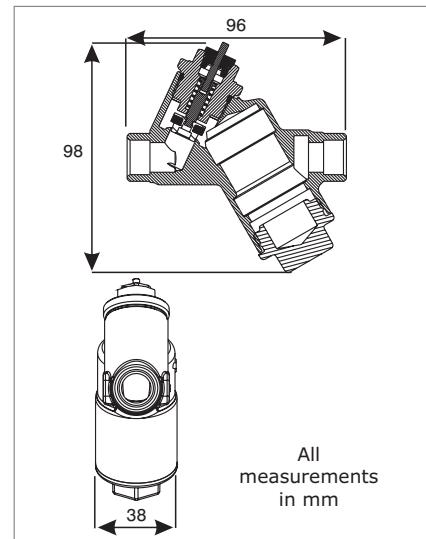

Glycolic mixtures in any solution are applicable (both ethylene and propylene).

The use of strainer is recommendable

Weight = 0.431 Kg

Height incl. actuator = 135 mm

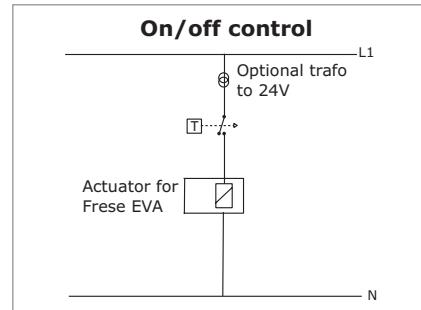

Stroke = 2.5 mm

Application Example

The system is easily adjusted by adjusting the pump in accordance with the differential pressure required across the critical valve.

When this differential pressure is achieved, the system will automatically be balanced.
Min. differential pressure = the lower limit of the operating range of the valve.
See cartridge catalogue for required min. differential pressure.

Technical specifications

The valve should be made of hot forged brass and should operate by means of a flow rate cartridge, that is readily accessible without dismantling the valve from the piping system.

The pressure range of the valve should be PN16.

With the actuator fitted the valve should operate in the temperature range between 0°C and 50°C (ambient temperature).
